---

Hello!

My name is Anthony Do and I am a full stack developer proficient in three different full stacks development processes; These include Python, C#/Asp.net and MERN stacks. I am a Full Stack Developer that actively dives into the unknown to engineer new solutions.

I have graduated from the Coding Dojo Bootcamp and created many projects alone and as part of teams. My solo projects are about learning new concepts and putting them into practice; While group projects are about being able to work and communicate efficiently with a team of varying sizes. During my solo projects it's all about breaking down the project into bite sized features that are more manageable and then integrating them together. Through group projects I learned collaboration skills that allowed us to make something that we couldn't do alone.

The most Important skills that I learned from the coding bootcamp are wireframing and modularization. When using figma to wireframe it allows for a simplified clickthrough experience that allows for rapid prototyping. Once a wireframe is complete allows me to see how each part can be broken down and reused in other parts of the application.
